High Performance in Timber Construction

Mountain Restaurant, Männlichen, Grindelwald

We at neue Holzbau AG are specialists in timber construction engineering. Our GSA®-Technology is unique and innovative. We are partners in our industry that link between the timber engineers, the architects and the contractors.

Whether you prefer advisory services, engineering services or the total project package from the beginning to completion, we are happy to accommodate your needs.

New Gstaad airport, Saanen

We specialise in designing high-performance connectors. We research new connector technologies, bonding techniques and the use of different timber types, such as hardwoods.

Hardwoods are ideal in terms of shear and tensile strength. Timber construction has never been as efficient as it is today. Now, structural elements can span large distances, elegant arches and minimalist builds are all possible with timber.

In addition, GSA®-Technology makes aesthetically pleasing and nearly invisible connectors possible. If you have a vision for your timber project, we can help you realise it.

Building with Timber Protects the Climate

Build with timber, protect the climate. Burning timber releases the same amount of CO₂ that the tree took in during its growth. The CO₂ is bound when used for building. A total of 766 kilograms of CO₂ is bound in one cubic meter of spruce, while ash and beech bind 1'125 kilograms of CO₂ per cubic meter.

Each year we process nearly 9,000 cubic meters of timber and bind around 7'500 tons of CO₂. A car emits an average of 200 g of CO₂ exhaust fumes per kilometre. (The 7'500 tons equals around 37.5 million kilometres of exhaust fumes.)

It's clear that our customers make a huge contribution to saving the climate.

Bridge Neumatt, Burgdorf 4)

We have two decades of experience in the production of glulam with spruce. In addition to ash and beech, we also produce elements in oak and robinia.

Future Tree 15)

80 percent of the timber we use comes from Swiss forests. In our raw laminate warehouse, we store over 50 different elements.

Timber is renewable, completely recyclable, and does not affect the ecological balance. New processing techniques and the GSA®-Technology have increased the scope in which timber can be used.

Timber products such as Accoya® can even be used outdoors without a problem.

N'H International AG CNC technique is the most modern and versatile in Switzerland.

We are able to produce, to the exact millimetre, high-quality work in every dimension and form.

Our multi-purpose machine allows each timber element to be produced optimally. From slats to arch beams, no element is too small or big for us.

Our planning department is very experienced, capable and efficient. Thanks to our direct relationship with production, we can advise you in each step of the process. You'll reap the benefits of our experience as we guide you through every project phase.

From your plans, we can undertake the engineering, shop drawings and materials list as well as production. We will organise the transport and logistics, 'pack and go', and will deliver the products to the site 'just in time'.

We will support you in the assembly and fitting. Our latest CAD/CNC technology, GSA®-Software, BIM and user-friendly plugs bring a high level of efficiency to the project.

If required, we can also provide an informative 3D visualisation for your customers. In our research laboratory, we are developing new possibilities and uses of 3D technology for timber construction engineers.

GSA®-Technology

The Perfect Connector System

Together with Professor Ernst Gehri, neue Holzbau AG has developed GSA®-Technology, an innovative connector system for timber projects. We have been implementing this system for two decades, and GSA®-Technology can be found in more than 2,000 projects worldwide.

Our in-house research laboratory allows us to test specific objects and quickly obtain certification.

GSA®-Technology is an ideal connector system for challenging timber constructions. Three components are used: steel, timber and resin.

GSA®-Technology simplifies the work of the engineer. Ductility, rigidity and load-bearing capacity are guaranteed.

GSA®-Technology offers a number of key advantages:
 Standardized system: This means high availability and a short response time.

Higher level of completion: This means a higher level of precision and quality, as well as lower costs.

Architecture: Aesthetically appealing, nearly invisible connections.

Fire prevention: The connectors are protected, thereby improving fire behaviour.

Efficient assembly due to the GSA® plug connector elements.

GSA®-Technology is currently the highest performing and most complete connector system in timber construction.

Kiwi Lerberg, NO 19)

International

Community Center, Portsmouth UK

With the development of GSA®-Technology, neue Holzbau AG has established itself as a leader in timber connector techniques.

Now, large spans, elegant arches and minimalist structures pose no problem. In addition, various timber types widen the spectrum and possible applications in architecture.

Timber as a building component has a thousand-year tradition. Today's timber construction is highly advanced. New processing and connector techniques have also increased the application possibilities.

Whatever your ideas, our engineers and technicians can help you find the best solution. Our aim is to apply the use of timber optimally.
